

Gradually increasing Hedgehog (time course): the mitogen-responsive $\text{EZH2} \rightarrow \text{H3K27me3}$ brake lags the Gli1 gas and progressively represses CyclinD1

(A) Gradually rising Hh: the gas leads, the brake lags
Gli1 tracks Hh quickly; slow $\text{EZH2} \rightarrow \text{H3K27me3}$ catches up behind

(B) CyclinD1 reined in as the brake engages
the drive climbs with Hh; H3K27me3 progressively represses it
