

Mother-G2 p27 integrator ensemble — NEGATIVE result: prototype does NOT reproduce the Overton bifurcation

N=60 cells heterogeneous in mitogen ($k_{Cd_translation}$, lognormal). With the integrator ON the quiescent fraction SATURATES ≈ 1 (birth-p27 floor: $p27=P21_div+g \cdot Sg2$ can only raise p27); OFF it is 0. Needs redesign (see docstring).

A. SATURATED, not graded: ON ≈ 1 at all mitogen (want $\downarrow$ with mitogen)

B. Fate composition (mother-G2 ON)

C. Dwell distribution at SHH=0.45 (the split)
