

EZH2 half-life (kDeEZ) sweep — the H3K27me3 mark's ramp-up/down effects require a SLOW-turnover EZH2 (GNP, N=50/cond)

(A) RAMP-UP entry — the gap = mark ENTRY suppression

(B) RAMP-DOWN withdrawal — the gap = mark WITHDRAWAL memory

(C) MECHANISM — mark accumulates as EZH2 lives longer

(D) HYSTERESIS loop width vs EZH2 half-life
