

Soluble EZH2 is a concentration: preserved at symmetric division, reset by ~10 h turnover — not amount-halved

The legacy $\div 2$ sawtooth is replaced by a smooth, turnover-limited writer carryover from mother to daughter; a compensating kTIEZ re-fit keeps every EZH2 level/ratio unchanged (validation-neutral).

(a) EZH2 across divisions (GNP): sawtooth vs smooth

(b) One division: halving jump vs smooth ~10 h decay

(c) Validation-neutral: levels & phase ratios preserved
