

MB is p27-high / G0-rich via a higher MB-specific BIRTH p27 — a FOLD-SAFE attractor lever (v44)

Born-high p27 (P21_div 1.8 vs GNP 0.6) latches the Skp2-p27 toggle low → a growth-timed G0 window, WITHOUT perturbing the hard 5.07× MB/GNP CyclinD1 fold.

Panel (c): making MB G0-rich via kSyP21 (steady-state p27 synthesis) instead of birth-p27 slows commitment enough that whole-cycle EZH2 over-represses CyclinD1 — the MB/GNP fold clears the tolerance-band edge and becomes data-excluded. The birth-p27 lever opens the same G0 window while staying inside the band.
