

Impact of EZH2 inhibition (CyclinD1 de-repression) on the cell cycle — v44 model

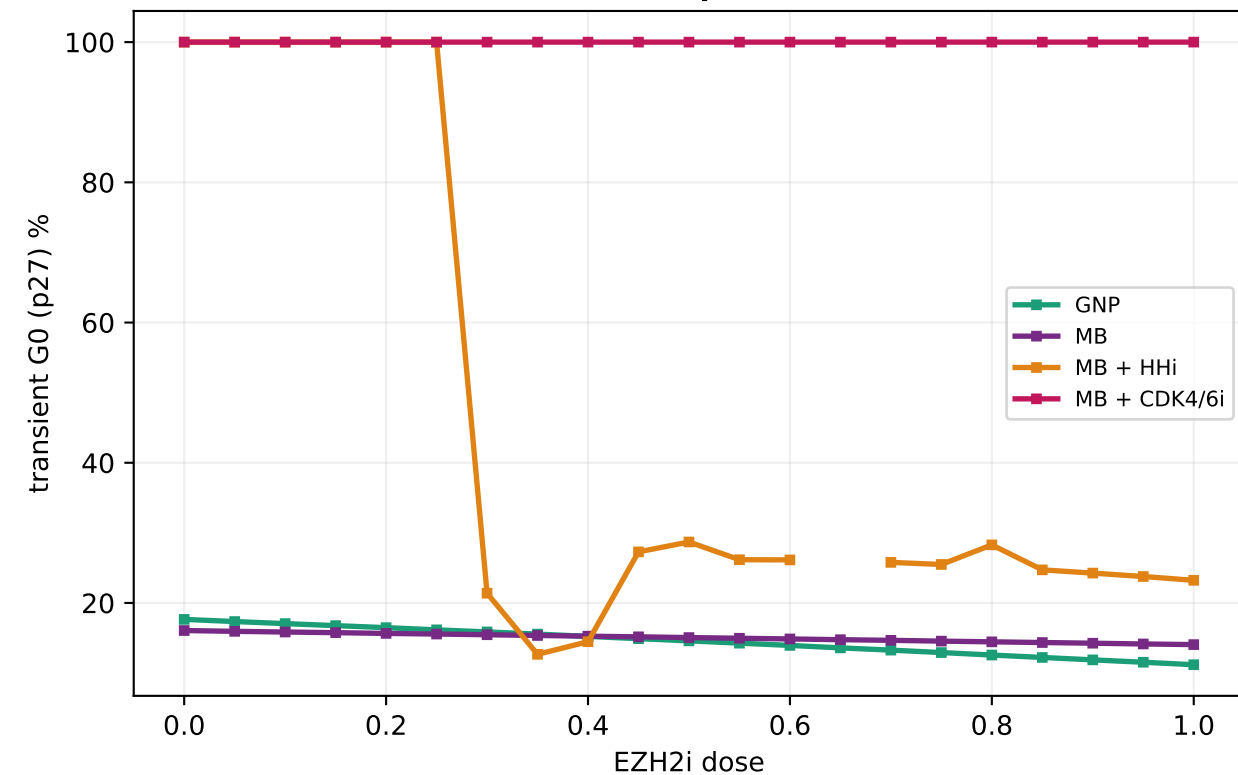

(a) EZH2i de-represses CyclinD1
(solid = transcript, dashed = protein)

(b) Proliferation vs EZH2i dose
(MB+HHi: threshold rescue; CDK4/6i: no rescue)

(c) EZH2i shrinks the transient G0
(cells leave quiescence)

(d) Proliferation is set by CyclinD1 protein
(EZH2i moves cells along this axis)
