

CDK4/6i dose-response fit to the two measured doses (pRb-positive, reversible)

Model = v44 MB/GNP populations (CyclinD1 CV 0.70 + CKI CV 0.42), palbo as graded residual CDK4/6 activity, $\text{resid} = K/(K+C)$. Fits both measured doses; every divider is pRb⁺.
 CAVEAT: the bistable R-point makes the drop STEEP (IC₅₀ ~0.7 μM , ~saturated by 2 μM) — a testable prediction; widening heterogeneity does not soften it. Dotted = drug-in
