

EZH2 protein degradation sweep (kDeEZ) — withdrawal-ramp decay vs the measured within-cycle phase ratio (GNP, Hh 0.75, mark ON, N=60/value)

(A) Impact of kDeEZ on the Hh-withdrawal EZH2 decay
(normalized; red = ramp 0.75→0.05, grey = floor)

(B) Within-cycle EZH2 phase ratio vs kDeEZ
the measured G2/G0=1.50× is the constraint (which kDeEZ still fits?)
