

EZH2 protein-by-phase fit — raise baseline transcription (kEZbas), then kDeEZ set by the G0/withdrawal drop (GNP, Hh 0.75, mark ON)

(A) Fit landscape — protein SSE
 ○ = mRNA also ~2× (scRNA-seq); ★ = joint best

(B) Best fit: kEZbas=0.004, kDeEZ=0.0005 ($t^{1/2}$ 23h)
 protein 1.5× & mRNA ~2× both matched

(C) EZH2 across the cell cycle (fitted baseline)
 rise in S → peak G2 → drop at division, on ongoing G0 baseline
