

EZH2 abundance over the GNP developmental period — WITH vs WITHOUT H3K27me3 at matched output (Hh 0.75 vs 0.22), N=300/cond

(A) EZH2 over the developmental period — tracks the cycle/mitogen
At MATCHED output the arms CONVERGE (steady EZH2 ≈ 1.0 both, despite $3.4\times$ Hh)

(B) EZH2 (solid) vs CyclinD1 (dashed) in the same cells
the EZH2 $\rightarrow$ CyclinD1 feedback; within a ramp both rise (cycle-driven)
