

Single-cell ensemble (N=28, heterogeneous temporal properties) through Hh withdrawal — transient G0 & period lengthening

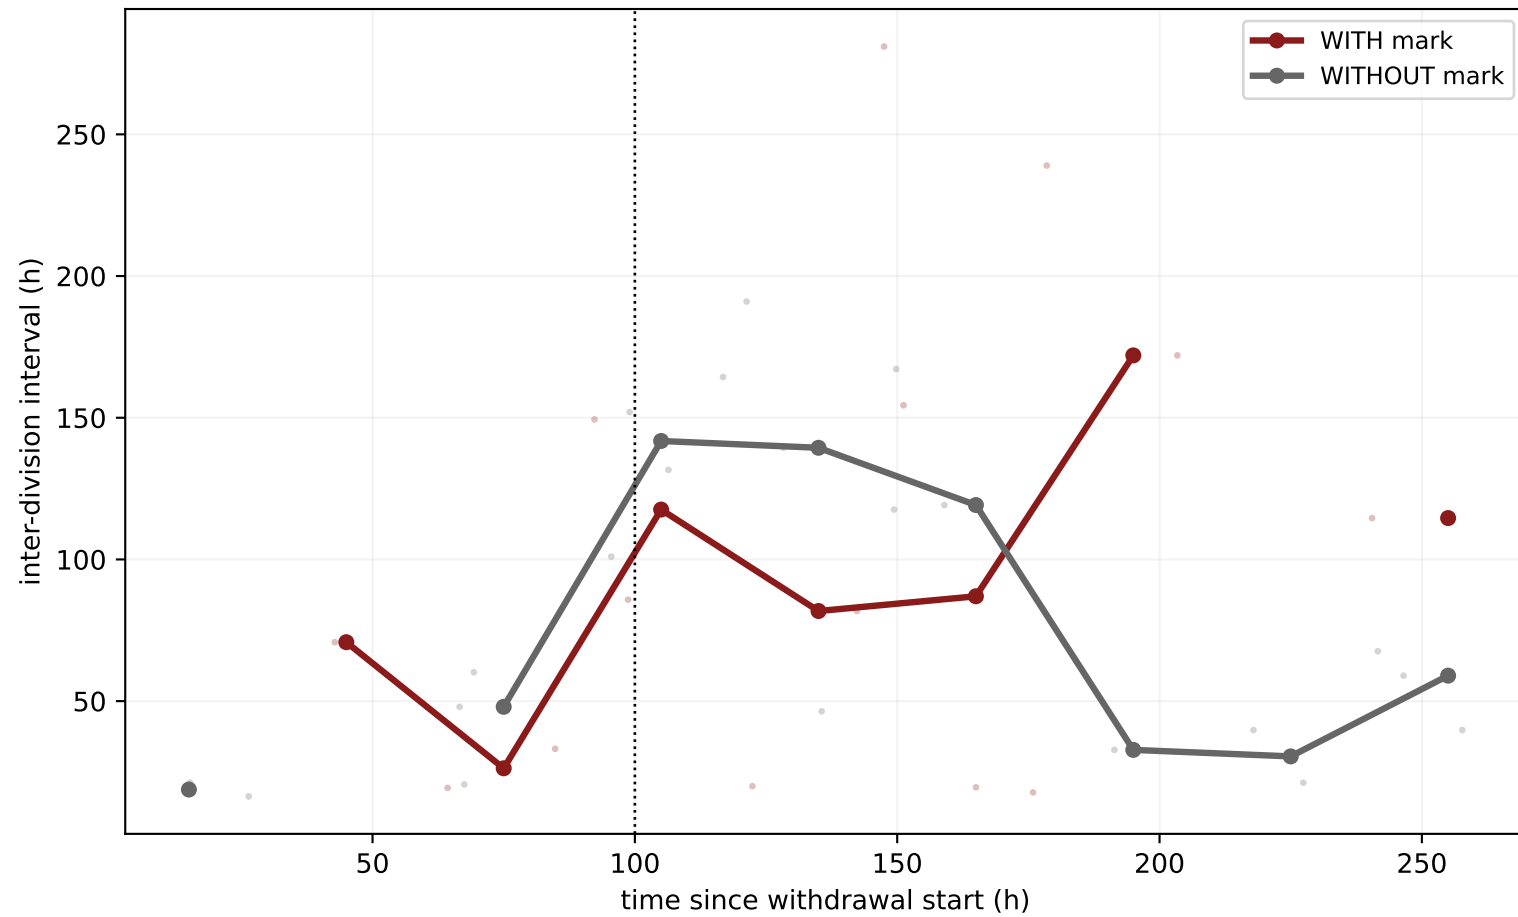

(A) WITH mark — single-cell states through Hh withdrawal
green cycling · orange TRANSIENT G0 · dark ARREST · ticks=divisions

(B) Example cells (WITH mark): CyclinD1 oscillations slow & shrink; p27 (dotted) rises into G0 as Hh withdraws

(C) Cell-cycle period LENGTHENS through withdrawal
(median per time-bin; points = individual cycles)

(D) G0 & arrest through withdrawal — WITH vs WITHOUT mark
