

Single-cell ensemble (N=1000, heterogeneous temporal properties) through Hh withdrawal to SHH=0.50 — transient G0 & period lengthening

(A) WITH mark — 1000 single-cell states through Hh withdrawal
green cycling · orange TRANSIENT G0 · dark ARREST

(B) Example cells (WITH mark): CyclinD1 oscillations slow & shrink;
p27 (dotted) rises into G0 as Hh withdraws

(C) Cells SLOW approaching arrest (each aligned to its own G0)
arrested cells only; median $\pm$ IQR — the last cycle is the longest

(D) G0 & arrest through withdrawal — WITH vs WITHOUT mark
