

Calibrated CyclinD1 variance-buffering: at σ^* where model reproduces the measured CV 0.7, EZH2i is predicted to widen CyclinD1 CV to 0.82 (1.18 $\times$)

**(A) Transfer function
(EZH2 caps the high end)**

**(B) Calibrate: σ^* matches the measured
with-EZH2 CV $\rightarrow$ predicts the without-EZH2 CV**

**(C) Predicted buffering vs setpoint spread
(modest, ~ 1.1 -1.24 $\times$; weakly spread-dependent)**
