

**(A) EZH2i de-represses CyclinD1 → rescues the vismo-arrested MB cell**

**(B) Mechanism: EZH2i blocks H3K27me3 deposition → mark cleared by demethylation + dilution**

**(C) Fast-track: EZH2i triggers CyclinD1 de-repression whenever it is given (dotted = dosing time)**

**(D) Rescue is available on-demand (de-repression completes whenever EZH2i is given)**
