

Population layer: GNP vs medulloblastoma transient-G0 -- quiescence-onset vs mitogen + Spencer sister concordance

N=100/type. p27 & CyclinD1 spreads kept wide (EGL/culture G0 quantification is untrustworthy) -> GNP keeps a small p27-high minority, not 0%; birth-p27 heterogeneity inherited by sisters. Snapshot G0 fraction: absolute scale uncertain, GNP < MB is the claim.

(A) Snapshot G0 fraction (SHH=0.5)
small in GNP, larger in MB (both quiescent minorities)

(B) Quiescence onset vs mitogen (SHH)

(C) Spencer sister concordance
