

Decreasing EZH2 EXPRESSION: more divisions & shorter G0, but ~same cycle period

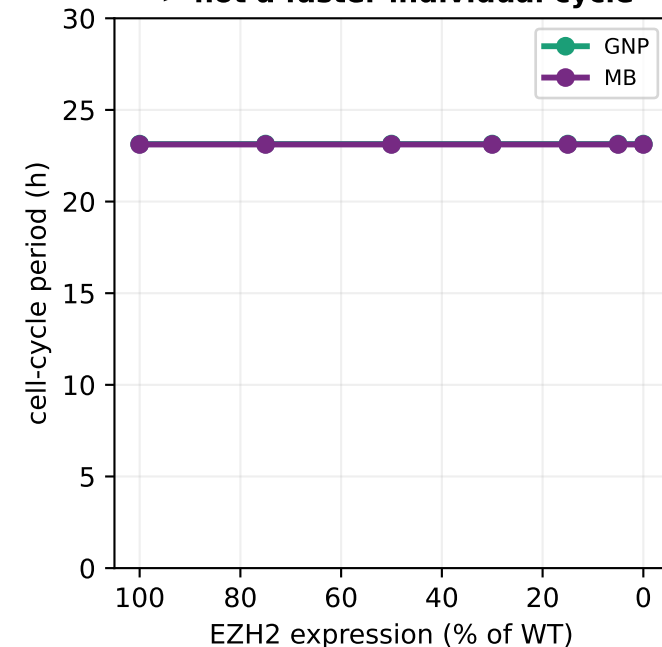

(a) Less EZH2 -> more CyclinD1

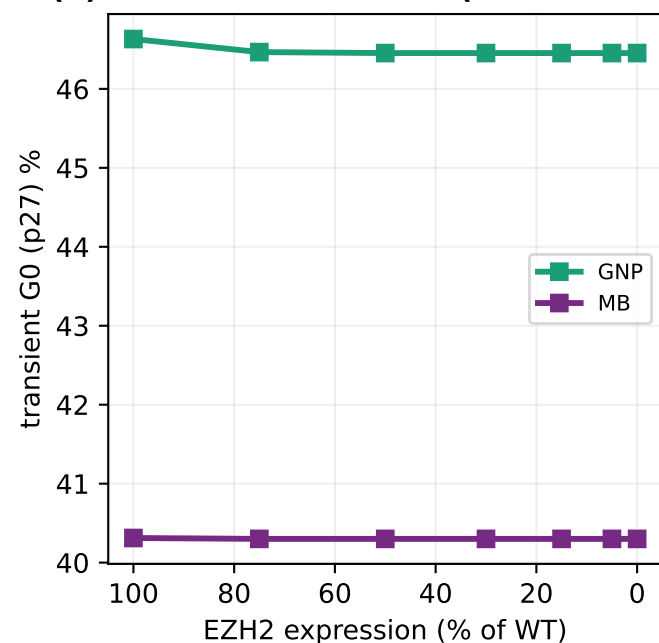

(b) Division RATE (net output) rises

(c) PERIOD is ~flat (growth-limited) -> not a faster individual cycle

(d) Transient G0 shrinks (faster G0->G1)

(e) Dynamic step-down (GNP): drop EZH2 mid-run -> CyclinD1 rises, divisions speed up
