

Whole GNP developmental period — WITH vs WITHOUT H3K27me3 at MATCHED output (mean 8.3 vs 8.5 div; Hh 0.75 vs 0.22; 100h window caps the tail), N=300/cond

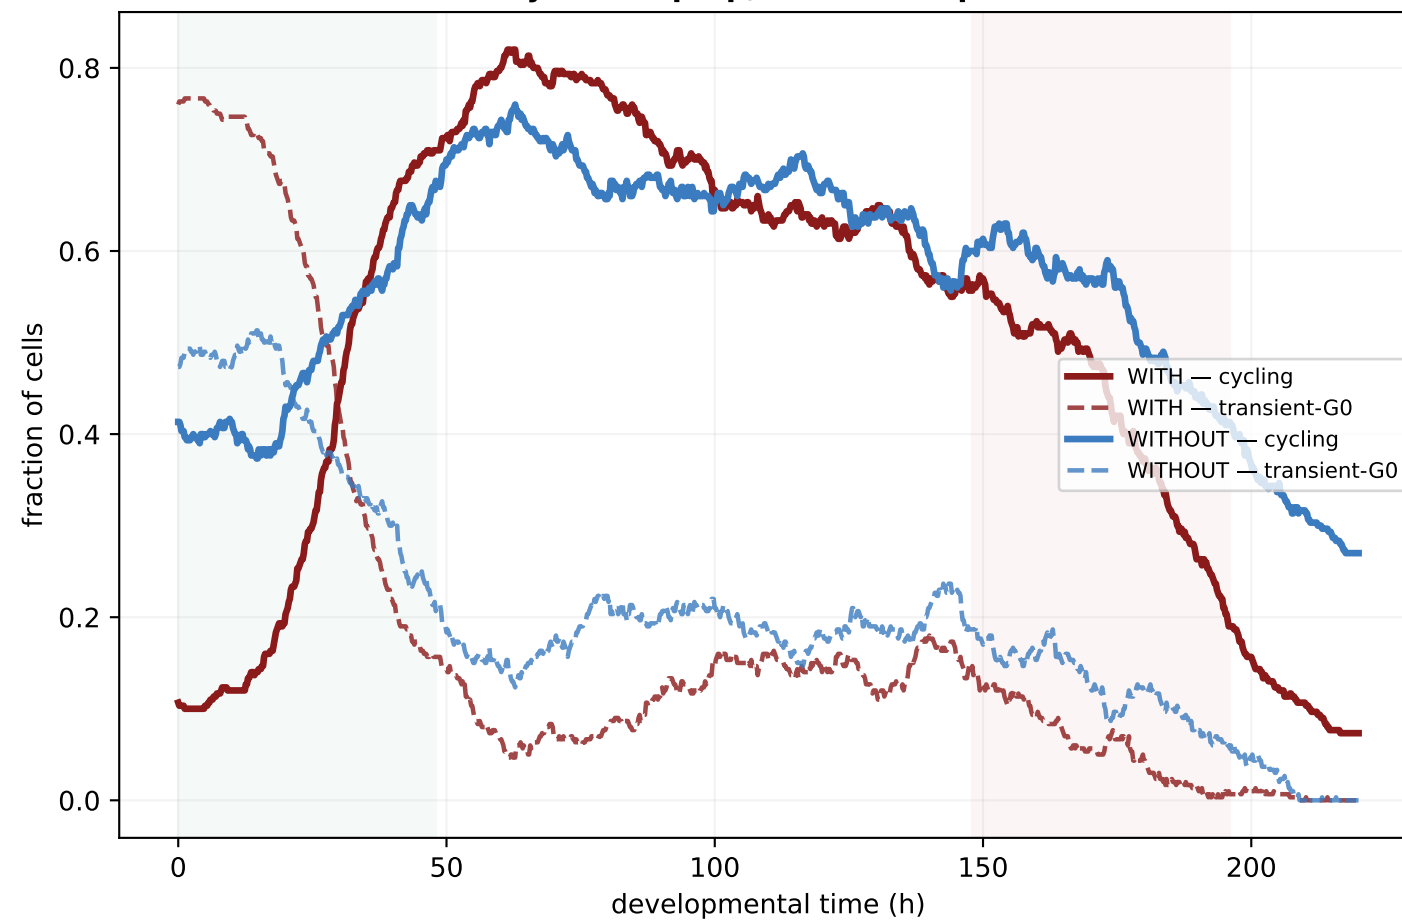

**(A) Developmental Hh trajectory — ramp up → sustain → ramp down
MATCHED OUTPUT needs a HIGHER plateau WITH the mark**

(B) Division-count distribution — MATCHED at mean~8, tail CAPPED by the 100h window

**(C) Population dynamics: cycling (solid) & transient-G0 (dashed)
entry on ramp-up, exit on ramp-down**

**(D) CyclinD1 over the period — WITH mark actually HIGHER
(~3.4× Hh over-compensates the repression; same divisions at higher CyclinD1)**
