

Calibrated distributions + division-inheritance partition noise (N=200/level/condition) — prototype

(A) Calibrated distributions, NO partition noise
(fixed birth-p27 per lineage — each cell has ONE fate)

(B) Calibrated + PARTITION NOISE ($\sigma=0.3$) at each division
(birth-p27 redrawn per cycle)

(C) NO noise: near-threshold lineages already recur through G0
on a REGULAR (deterministic multi-periodic) schedule (SHH=0.55, WITH mark)

(D) + PARTITION NOISE ($\sigma=0.3$): the recurrence becomes
IRREGULAR / stochastic — sister divisions diverge (SHH=0.55, WITH mark)
