

EZH2 rate fit vs DMSO + HU + scRNA-seq (MB55, MB context, N=24) — Pal/RO pending arrest-analog fix

(A) Fine fit landscape — ★ best
kEZbas=0.00099, kDeEZ=0.00015 ($t_{1/2}$ 77h)

(B) Best fit vs data — DMSO & HU protein + mRNA
(HU longer-S boost captured; Pal/RO excluded — model 2N-collaps@around kEZbas 0.004 / kDeEZ 0.0005; blue→red = low→high value)

(C) Secondary rate-var sensitivity
(around kEZbas 0.004 / kDeEZ 0.0005; blue→red = low→high value)
