

Memory-mark CyclinD1 MB/GNP conflict in a REALISTIC sustained-division population (GNP vs MB ensembles, N=40)

(A) Population fold climbs to raw ~7 as the mark strengthens -- conflict SURVIVES the population

(B) The mark SATURATES the dividing population too (rebuild beats division-dilution) -- no graded window

(C) Mark distribution: memory mark piles up at $M_k \sim 1$ (saturated), baseline stays low/graded
