

# Impact of EZH2 inhibition (CyclinD1 de-repression) on the cell cycle — v44 model

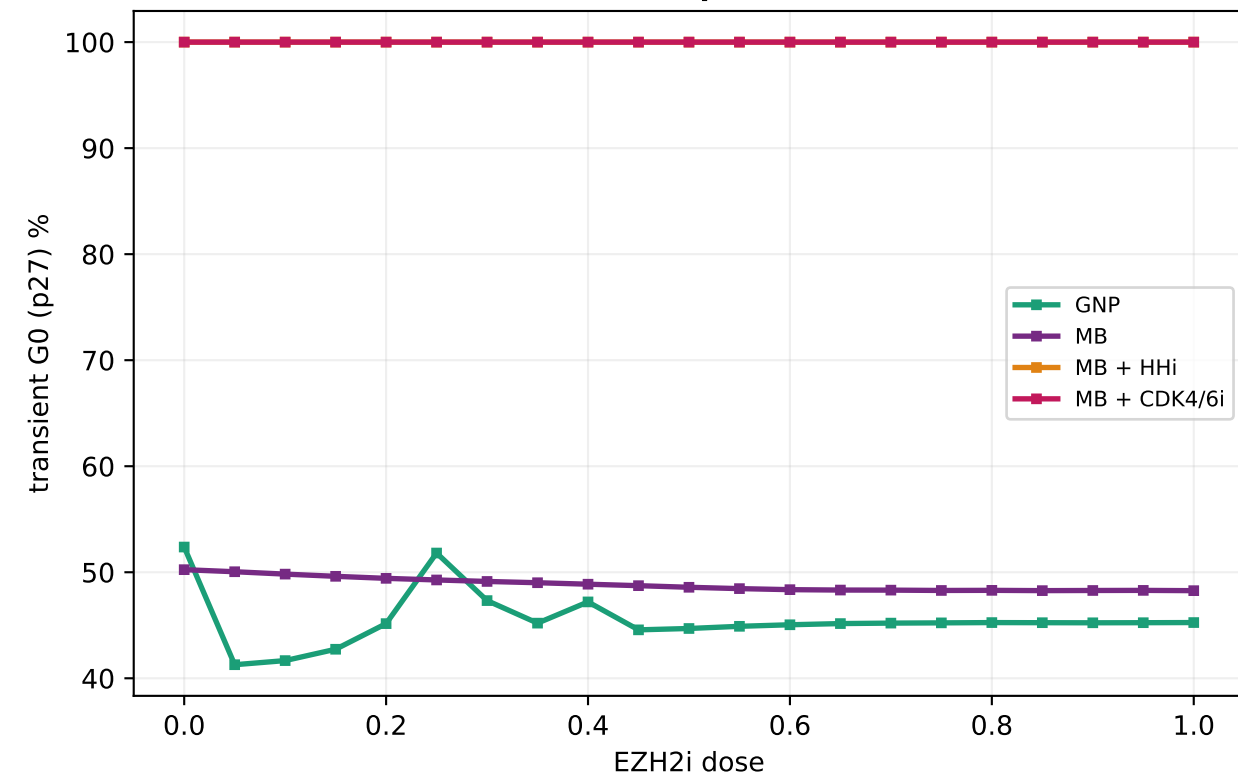

**(a) EZH2i de-represses CyclinD1**  
(solid = transcript, dashed = protein)

**(b) Proliferation vs EZH2i dose**  
(MB+HHi: threshold rescue; CDK4/6i: no rescue)

**(c) EZH2i shrinks the transient G0**  
(cells leave quiescence)

**(d) Proliferation is set by CyclinD1 protein**  
(EZH2i moves cells along this axis)
