

(a) CyclinD1 sets transient-G0 duration
(all knobs collapse; arrest below threshold)

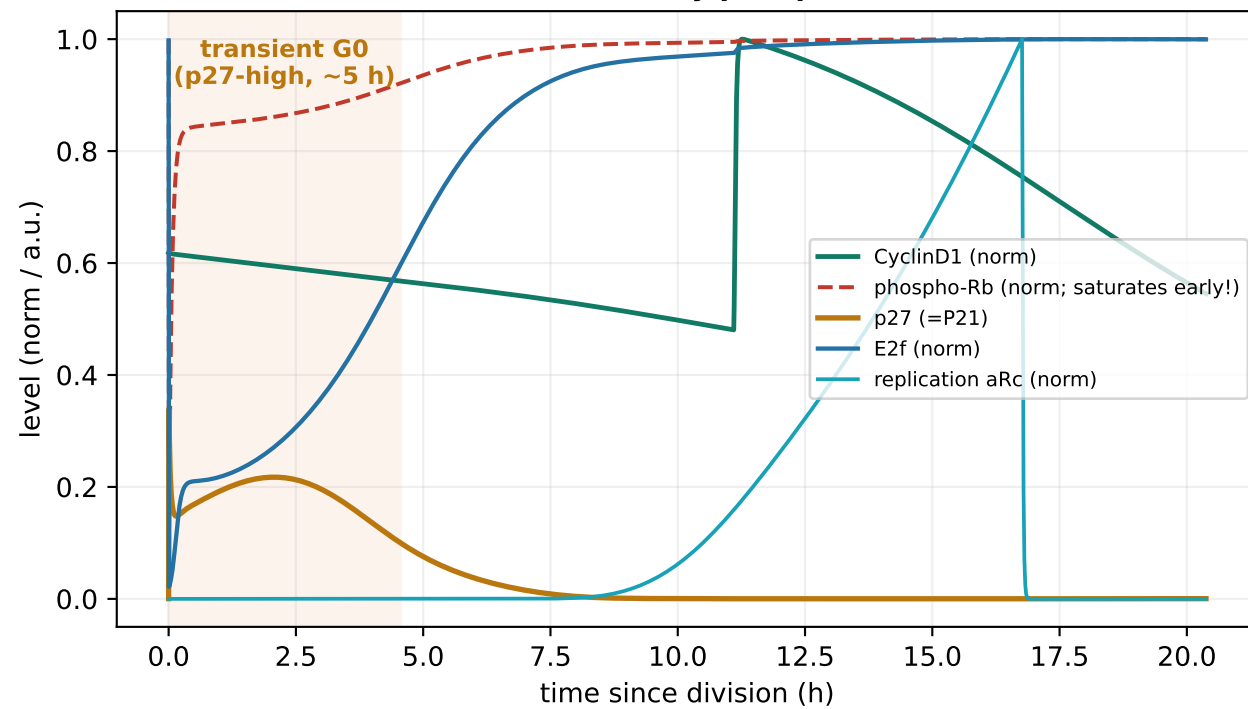

(b) Phase partition vs CyclinD1
(G0 shrinks into G1/S; period ~constant)

permanent
G0 (arrest)

(c) One cycle (GNP): the transient G0 is p27-high / E2f-low, NOT marked by phospho-Rb

(d) EZH2 inhibition de-represses CyclinD1 and collapses the transient G0
