

(A) Sudden vismo: divisions vs dose
feedback gap (shaded) opens at high vismo — the MYCN-floor partial withdrawal

(B) Gradual vismo: divisions vs dose
(GDC ramped 0 $\rightarrow$ dose over 60 h)

(C) Per-cell distribution at full vismo (GDC=0.95)
+feedback $\rightarrow$ arrest; -feedback (EZH2i) $\rightarrow$ rescue / coast

(D) Representative MB cell, sudden vismo (GDC=0.95)
no-feedback: MYCN-floor CyclinD1 sustains cycling; feedback: EZH2 represses it $\rightarrow$ arrest
