

Worked cell-cycle trace through a triangle mitogen ramp (150 h/leg, default timing) — how the CyclinD1-SHH hysteresis loop is drawn

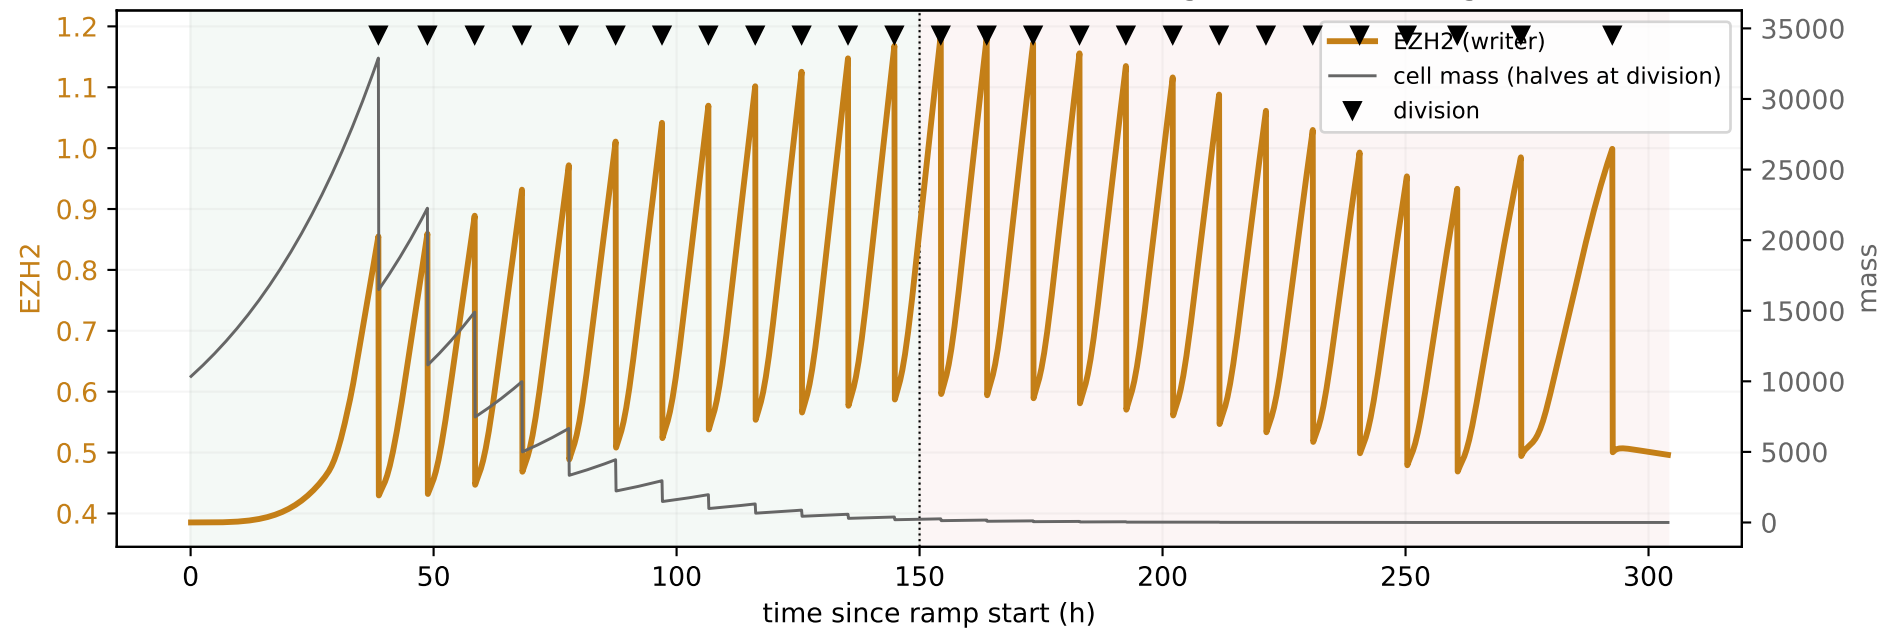

(A) Triangle mitogen ramp — UP (green) then DOWN (red)

(B) CyclinD1 sawtooth + H3K27me3 mark: mark accumulates in arrest, diluted by divisions, lags SHH

(C) EZH2 writer + divisions — 12 divisions on UP-leg, 14 on DOWN-leg

(D) The hysteresis loop traced by this ONE run (faint = raw sawtooth, bold = cycle-averaged)
