

H3K27me3 tension at Ccnd1: EZH2-driven methylation (integrates S-phase + mitogen) vs replicative dilution → CyclinD1 transcript

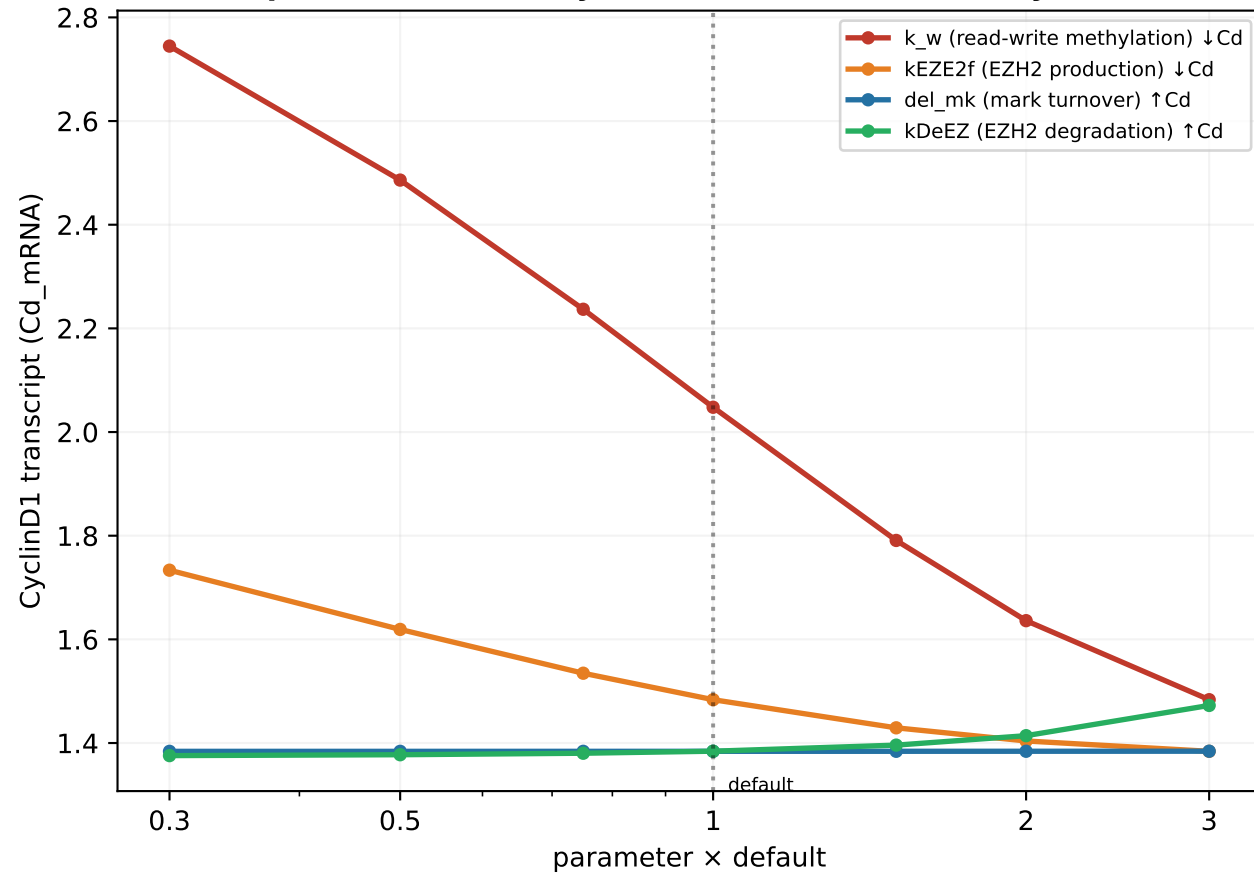

(A) CyclinD1 transcript over the tension mediators (mitogen × S-phase duration)

(B) EZH2 integrates S-phase duration longer S → more EZH2 → more mark → less CyclinD1

(C) Control parameters of the tension deposition knobs ↓ CyclinD1; removal knobs ↑ CyclinD1

(D) Deposition vs dilution stronger methylation ↓ Cd, but dilution keeps clawing it back
