

(A) EZH2-CyclinD1 phase plane (GNP)
negative feedback → single stable node (monostable, buffering)

(B) Mitogen drive & feedback removal move the operating point
(dashed = Cd-nullcline per condition; EZH2i → un-repressed)

(C) Proliferation-quiescence bifurcation vs CyclinD1 drive
EZH2 feedback shifts the threshold to higher drive (dashed = onset)

(D) Mitogen bifurcation: EZH2 feedback raises the mitogen threshold for proliferation (gated quiescence)
