
Model = v44 MB/GNP populations (CyclinD1 CV 0.70 + CKI CV 0.42), palbo as graded residual CDK4/6 activity, resid=K/(K+C). Fits both measured doses; every divider is pRb
CAVEAT: the bistable R-point makes the drop STEEP (IC50 ~0.7 µM, ~saturated by 2 µM) — a testable prediction; widening heterogeneity does not soften it. Dotted = drug-in
