Decreasing EZH2 EXPRESSION: more divisions & shorter G0, but ~same cycle period
(a) Less EZH2 -> more CyclinD1
CyclinD1 transcript
EZH2 expression (% of WT)
GNP
MB
(b) Division RATE (net output) rises
divisions / 168 h
EZH2 expression (% of WT)
(c) PERIOD is ~flat (growth-limited)
-> not a faster individual cycle
cell-cycle period (h)
EZH2 expression (% of WT)
(d) Transient G0 shrinks (faster G0->G1)
transient G0 (p27) %
EZH2 expression (% of WT)
(e) Dynamic step-down (GNP): drop EZH2 mid-run -> CyclinD1 rises, divisions speed up
EZH2 protein
CyclinD1 transcript
divisions (MPF x8)
EZH2 expression
dropped to 10%
level (a.u.)
time (h)
