Impact of EZH2 inhibition (CyclinD1 de-repression) on the cell cycle — v44 model
(a) EZH2i de-represses CyclinD1
(solid = transcript, dashed = protein)
CyclinD1 fold (vs EZH2i=0)
EZH2i dose (0 = none, 1 = full)
GNP
MB
MB + HHi
MB + CDK4/6i
(b) Proliferation vs EZH2i dose
(MB+HHi: threshold rescue; CDK4/6i: no rescue)
divisions / 168 h
EZH2i dose
(c) EZH2i shrinks the transient G0
(cells leave quiescence)
transient G0 (p27) %
(d) Proliferation is set by CyclinD1 protein
(EZH2i moves cells along this axis)
CyclinD1 protein (mean, a.u.)
