Definitive bistability test — same SHH, two initial conditions, integrated to steady state
ACCUMULATE (stable EZH2, slow mark)
MONOSTABLE
(ICs converge)
calibrated / RELAX (control)
MONOSTABLE
(ICs converge)
from CYCLING IC (low mark)
from ARRESTED IC (high mark)
mean CyclinD1 Cd
mean H3K27me3 Mk
mitogen drive SHH (fixed; each point equilibrated from both ICs)
mitogen drive SHH (fixed; each point equilibrated from both ICs)
Gold = SHH where the arrested (high-mark) and cycling (low-mark) starts settle to DIFFERENT stable states → two coexisting attractors → bistable G0 lock.
