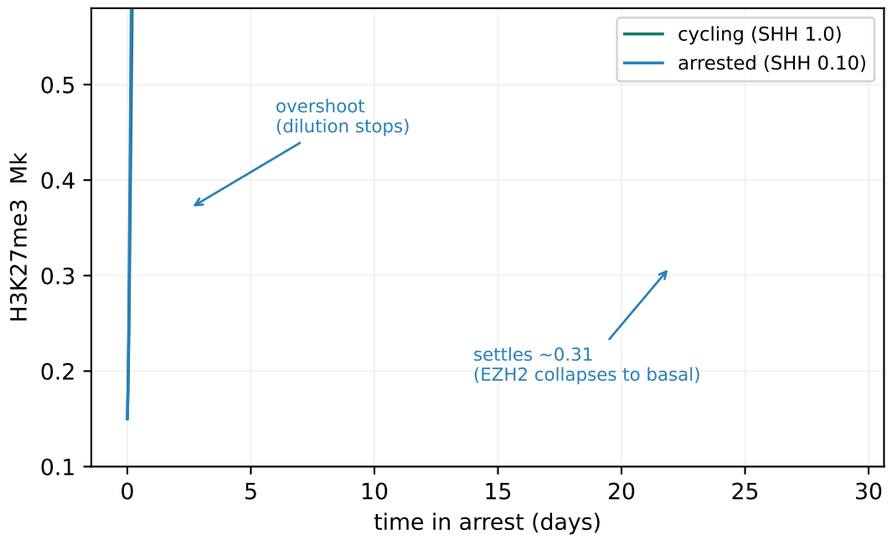
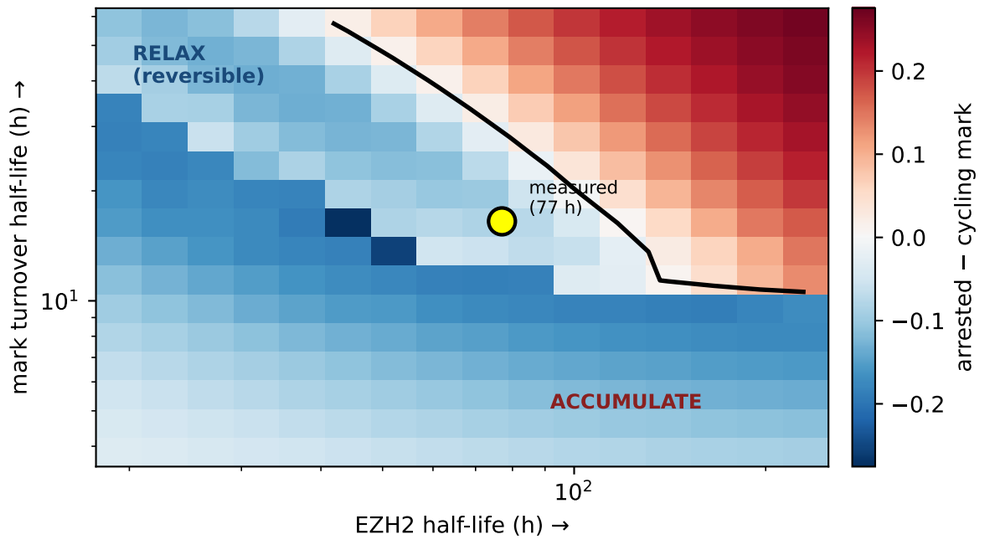
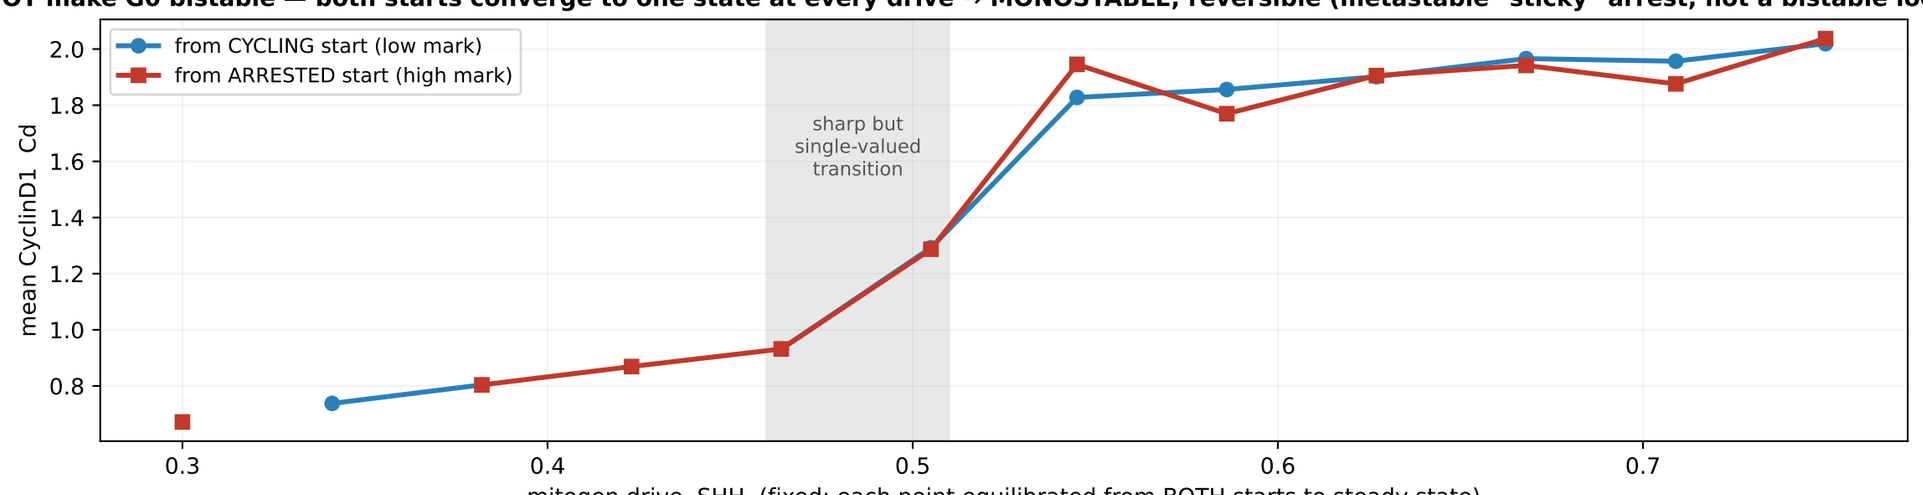
H3K27me3 in arrested G0: it plateaus (A), which way it goes is a writer-vs-turnover race (B), and it stays reversible — no bistable lock (C)

(A) The mark plateaus — it does not run away (writer EZH2 is E2f-gated, collapses in G0)



(B) Which way? A race: EZH2 persistence vs mark turnover (measured → RELAX, near fence)





(C) The mark does NOT make G0 bistable — both starts converge to one state at every drive → MONOSTABLE, reversible (metastable "sticky" arrest, not a bistable lock) [ACCUMULATE regime]
