v44 (Heldt-engine): 2D mitogen-sensitivity planes -- the Hh threshold to proliferate vs EZH2-feedback strength and the p16 CKI brake
A SHH x EZH2/H3K27me3-feedback strength
H3K27me3 leaky floor f_0 (lower = STRONGER feedback)
mitogen (SHH / Hh dose)
proliferation (divisions / 168 h)
default
cycle/arrest
stronger feedback
→ higher Hh threshold
B SHH x p16 (CKI brake)
p16 (INK4 / CDK4/6 brake)
mitogen (SHH / Hh dose)
proliferation (divisions / 168 h)
default
cycle/arrest
more CKI
→ higher Hh threshold
