v44 mitogen sensitivity in Hh activity (Gli1): CyclinD1 (top) and the EZH2 dose-response (bottom), GNP via SHH / MB via vismodegib, +/- the EZH2 ⊣ CyclinD1 feedback
A GNP CyclinD1 (mitogen = SHH →)
B MB CyclinD1 (vismodegib ←)
C GNP EZH2 dose-response (Fig 4H)
D MB EZH2 vs Hh activity
no feedback
EZH2 feedback
CyclinD1 protein (a.u.)
EZH2 (a.u.)
Hh activity = Gli1 transcript (a.u.)
feedback represses & flattens
CyclinD1 (lower mitogen sensitivity);
arrest region shaded
EZH2 now tracks the mitogen
DOSE (saturating) -> rises across
the wide rShh range, not just at
the commitment threshold
