

# H3K27me3 tension at Ccnd1: EZH2-driven methylation (integrates S-phase + mitogen) vs replicative dilution → CyclinD1 transcript

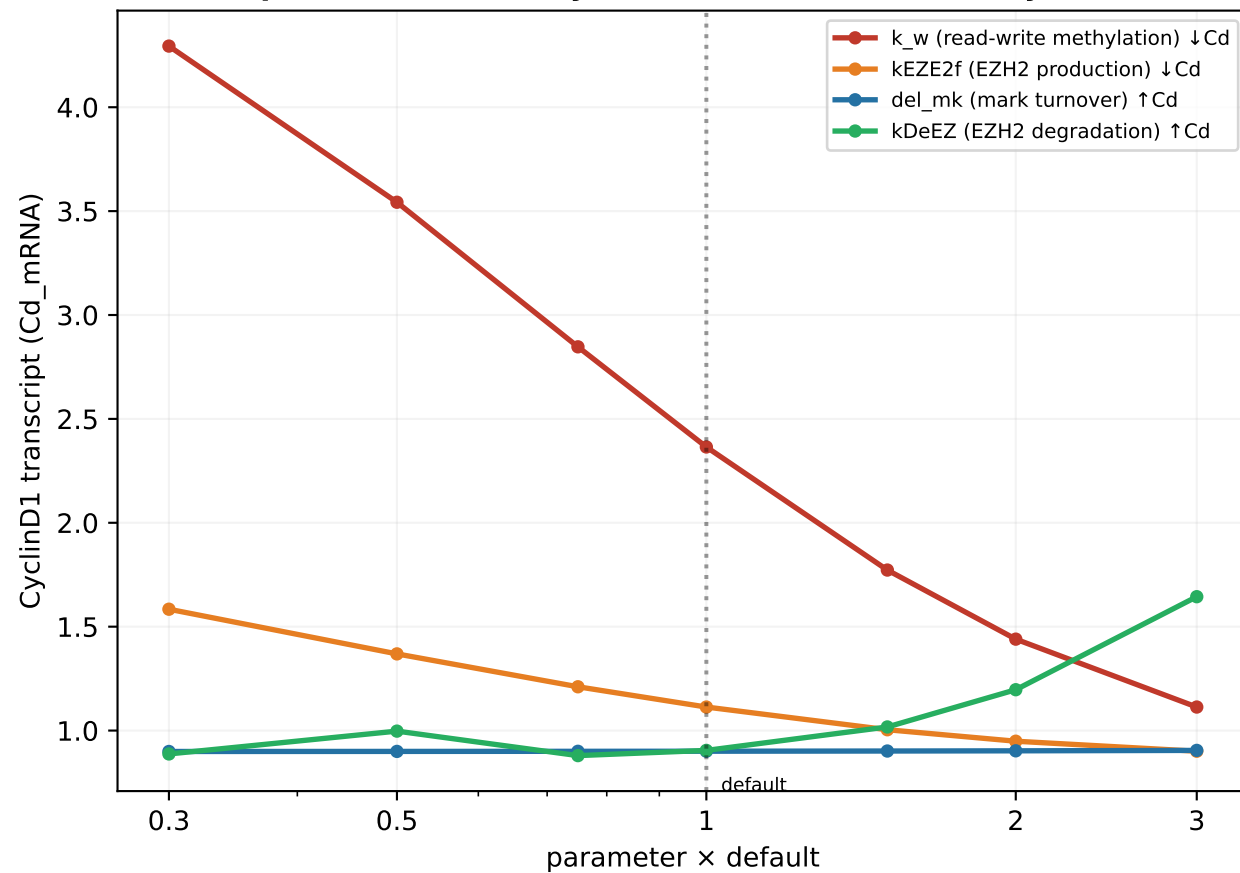

**(A) CyclinD1 transcript over the tension mediators  
(mitogen × S-phase duration)**

**(B) EZH2 integrates S-phase duration  
longer S → more EZH2 → more mark → less CyclinD1**

**(C) Control parameters of the tension  
deposition knobs ↓ CyclinD1; removal knobs ↑ CyclinD1**

**(D) Deposition vs dilution  
stronger methylation ↓ Cd, but dilution keeps clawing it back**
