

(A) The brake is mitogen-responsive
added Hh raises Gli1 AND EZH2→H3K27me3

Legend:
 Gli1 (Hh activity — the gas)
 EZH2 (the brake)
 H3K27me3 mark

(B) The brake is PROGRESSIVE
repression of CyclinD1 drive escaping H3K27me3 falls with

Y-axis: surviving fraction $R = \text{transcript} / \text{drive}$
 X-axis: Hedgehog (SHH dose)

Annotations:
 14% → 14% survive
 no repression

**EZH2 raises the Hh threshold
to proliferate: $\leq 0.08 \rightarrow 0.08$**
