

# Is the CyclinD1-SHH hysteresis caused by the H3K27me3 mark? — WITH vs WITHOUT repression control

**(A) CyclinD1-SHH loop at a fast ramp (58 h)**  
the mark **OPENS** the loop; without it up & down nearly coincide

**(B) Loop area vs ramp speed: with vs without the mark**  
the gold gap is the hysteresis the H3K27me3 mark contributes
