

Whole GNP developmental period — WITH vs WITHOUT H3K27me3 at MATCHED proliferative output (~11 divisions), N=300/cond

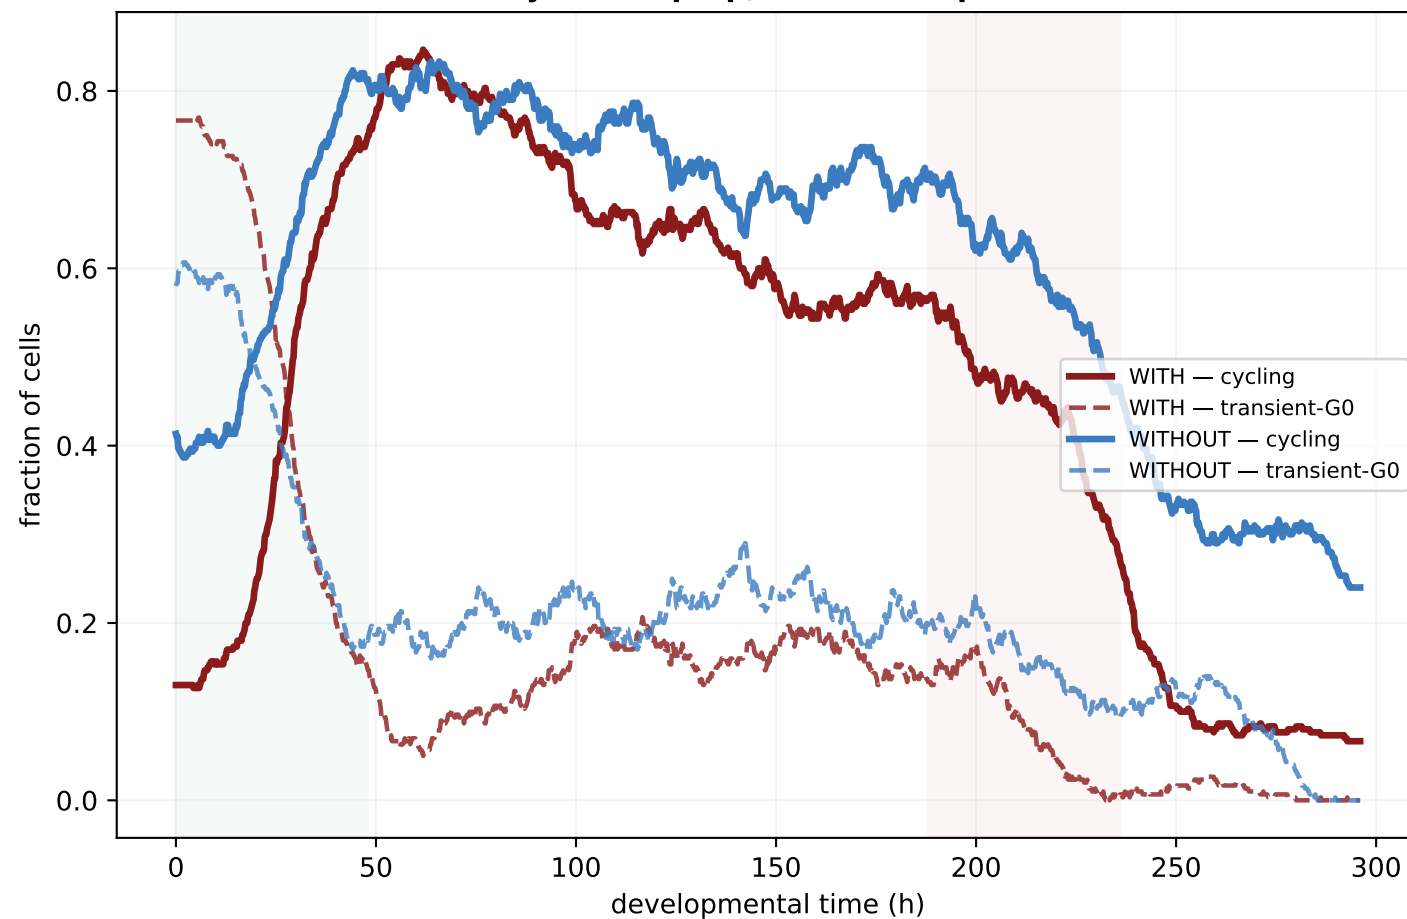

(A) Developmental Hh trajectory — ramp up → sustain → ramp down
MATCHED OUTPUT needs a HIGHER plateau WITH the mark

(B) Division-count distribution — MATCHED at ~8-12 by construction

(C) Population dynamics: cycling (solid) & transient-G0 (dashed)
entry on ramp-up, exit on ramp-down

(D) CyclinD1 over the period — WITH mark actually HIGHER
(2× Hh over-compensates the repression; same divisions at higher CyclinD1)
